CAUTIONS — READ FIRST!

READ THESE WARNINGS AND SAFETY PRECAUTIONS PRIOR TO INSTALLATION OR OPERATION. FAILURE TO COMPLY WITH THESE INSTRUCTIONS COULD RESULT IN PERSONAL INJURY AND OR PROPERTY DAMAGE. RETAIN THESE INSTRUCTIONS FOR FUTURE REFERENCE.

**WARNING** Pump, valves and all containers must be properly grounded prior to handling flammable fluids and/or whenever static electricity is a hazard.

**WARNING** Prior to servicing the pump, ensure that the air and fluid lines are closed and disconnected. While wearing personal protective equipment, flush, drain and process liquid from the pump in a safe manner.

**WARNING** The TX marking refers to the maximum surface temperature depending not on the equipment itself, but mainly on operating conditions. In this case, the maximum surface temperature depends upon the temperature of the process fluids.

**WARNING** For pump models with non-metallic manifolds, air valves, or chambers: When the relative humidity in the surrounding atmosphere is above 30%, the equipment must not be touched by personnel unless first wiped down with a damp cloth.

**WARNING** Maintenance must not be performed when a hazardous atmosphere is present.

**WARNING** Use only with liquid process fluid.

**WARNING** This equipment’s ambient temperature range is 32°F (0°C) to 104°F (40°C)

**WARNING** Do not operate the pump with fluids or in temperatures which are less than 32°F (0°C)

**CAUTION** The temperature of the process fluid and air input must be no more than 36°F (20°C) less of the maximum temperature allowed for the appropriate non-metallic material. See the list of temperatures below for each material’s maximum recommended temperature:

</tbody>
</table>

Temperature limits are solely based upon mechanical stress and certain chemicals will reduce the maximum operating temperature. The allowable temperature range for the process fluid is determined by the materials in contact with the fluid being pumped. Consult a chemical resistance guide for chemical compatibility and a more precise safe temperature limit. Always use minimum air pressure when pumping at elevated temperatures.

This product can expose you to chemicals including Nickel, Chromium, Cadmium, or Cobalt, which are known to the State of California to cause cancer and/or birth defects or other reproductive harm. For more information, go to www.P65Warnings.ca.gov.
MODEL DESIGNATION MATRIX - PLASTIC SOLIDS

WET END REPAIR KIT

Wet end kits are available and consist of 2 diaphragms, (back-up diaphragms if required), 4 MaxPass valves and 4 seat O-Rings. See matrix below.
PRINCIPLES OF OPERATION

HOW AN AIR OPERATED DOUBLE DIAPHRAGM PUMP WORKS

The air-valve directs pressurized air behind the diaphragm on the right, causing the diaphragm on the right to move outward (to the right).

Since both the right diaphragm and the left diaphragm are connected via a diaphragm rod, when the right diaphragm moves to the right, the left diaphragm (through the action of the diaphragm rod) moves to the right also.

When the diaphragm on the left side is moving to the right, it is referred to as suction stroke. When the left diaphragm is in its suction stroke, the left suction ball moves upward (opens) and the left discharge ball moves downward (closes). This action creates suction and draws liquid into the left side chamber.

The air-valve directs pressurized air behind the left diaphragm, causing the left diaphragm to move outward (to the left).

Since both the left diaphragm and the right diaphragm are connected via a diaphragm rod, when the left diaphragm moves to the left, the right diaphragm (through the action of the diaphragm rod) moves to the left also.

When the diaphragm on the left side moves outward, the left discharge ball moves upward (opens) and the left suction ball moves downward (closes). This causes the liquid to leave the left side liquid outlet of the pump.

Simultaneously, the right diaphragm moves inward (to the left), which causes the right suction ball to open and the right discharge to close, which in turn causes suction, drawing liquid into the right chamber.

The process of alternating right suction / left discharge (and vice-versa) continues as long as compressed air is supplied to the pump.

Note: The graphics show ball valves, which are replaced with Max-Pass™ valves for these pump models.
3/8" PUMP DIMENSIONS
PLASTIC SOLIDS

NOTE: AIR INLET IS ON THE SIDE WITH STAINLESS STEEL INSERT. THE AIR VALVE ASSEMBLY IS ON THE OPPOSITE SIDE OF THE PUMP.
**Performance Specifications**

- **Max. Flow:** 9 gpm (34.0 lpm)
- **Max. Air Pressure:** 120 psi (8.2 bar)
- **Max. Solids:** 1/4" (6.4 mm)
- **Max. Suction Lift Dry:** 17 ft-H₂O (5.2 m-H₂O)
- **Max. Suction Lift Wet:** 26 ft-H₂O (7.9 m-H₂O)
- **Weight Polypropylene & Conductive Nylon:** 3.8 lbs (1.7 kg)
- **Weight PVDF:** 5 lbs (2.3 kg)
- **Air Inlet:** 1/4" FNPT
- **Liquid Inlet FNPT/FBSPT:** 3/8"
- **Liquid Outlet FNPT/FBSPT:** 3/8"
- **Height:** 7.19" (182.6 mm)
- **Width:** 8.55" (217.2 mm)
- **Depth:** 4.82" (122.4 mm)

*Flow rates indicated on the chart(s) shown were determined by pumping water at flooded suction. For optimum life and performance, pumps should be specified so that daily operation parameters will fall in the center of the pump performance curve.*
SECTION 6

INSTALLATION, TROUBLESHOOTING AND MAINTENANCE

INSTALLATION

PIPING
Whenever possible ensure the pump is installed using the shortest possible pipe lengths with the minimum amount of pipe fittings. Ensure all piping is supported independent of the pump.

Suction and discharge piping should not be smaller than the connection size of the pump. When pumping liquids of high viscosity, larger piping may be used, in order to reduce frictional pipe loss.

Employ flexible hoses in order to eliminate the vibration caused by the pump. Mounting feet can also be used to reduce vibration effects.

All hoses should be reinforced, non-collapsible and be capable of high vacuum service. Ensure that all piping and hoses are chemically compatible with the process and cleaning fluid.

For processes where pulsation effects should be reduced, employ a pulsation dampener on the discharge side of the pump.

For self-priming applications, ensure all connections are airtight and the application is within the pumps dry-lift capability. Refer to product specifications for further details.

For flooded suction applications, install a gate valve on the suction piping in order to facilitate service.

For unattended flooded suction operation, it is recommended to pipe the exhaust air above the liquid source. In the event of a diaphragm failure this will reduce or eliminate the possibility of liquid discharging through the exhaust onto the ground.

LOCATION
Ensure that the pump is installed in an accessible location, in order to facilitate future service and maintenance.

AIR
Ensure that the air supply is sufficient for the volume of air required by the pump. Refer to product specifications for further details. For reliable operation, install a 5 micron air filter, air-valve and pressure regulator. Do not exceed the pumps maximum operating pressure of 120 psig.

REMOTE OPERATION
Utilize a three way solenoid valve for remote operation. This ensures that air between the solenoid and the pump is allowed to “bleed off,” ensuring reliable operation. Liquid transfer volume is estimated by multiplying displacement per stroke times the number of strokes per minute.

NOISE
Correct installation of the muffler reduces sound levels. Refer to product specifications for further details.

SUBMERGED OPERATION
For submersible operation, pipe the air exhaust to atmosphere.

GROUNDING THE PUMP
Loosen grounding screw and install a grounding wire. Tighten grounding screw. Wire size should be a 12 gauge wire or larger. Connect the other end of the wire to a true earth ground. Equipment must be grounded to achieve ATEX rating and it is recommended to configure the pump with a grounding lug option.
This illustration is a generic representation of an air operated double-diaphragm pump.

| Pump Cycles with Closed Discharge Valve | Debris stuck in check valve  
|                               | Excessive wear of check valves  |
| Pump Running Slowly/Not Steady| Air compressor undersized  
|                               | Leak in air supply  
|                               | Air-line, filter regulator or needle valve undersized  
|                               | Muffler partially iced or blinded  
|                               | Air valve gasket leak or misalignment  
|                               | Air valve wear/debris  
|                               | Pilot sleeve wear/debris  
|                               | Liquid fluid filter blocked  
|                               | Pump may be cavitating, reduce speed of operation  
|                               | Suction strainer clogged  |
| Pump Will Not Prime           | Air leak in suction pipe  
|                               | Air leak in pump manifold connections  
|                               | Suction strainer and lines clogged  
|                               | Excessive lift conditions  
|                               | Check valve wear  
|                               | Debris in check valve  |
OPERATION
The Air-Operated Double Diaphragm Pump requires a minimum of 20 psig of air to operate, with some variation according to diaphragm material. Increasing the air pressure results in a more rapid cycling of the pump and thus a higher liquid flow rate. In order to not exceed 120 psig of inlet air pressure, and for accurate control of the pump, it is suggested to use a pressure regulator on the air inlet.
An alternate means of controlling the flow-rate of the pump is to use an inlet air valve and partially open or close accordingly. When the air valve is completely in the closed position, the pump will cease to operate.
A third method of controlling the flow rate of the pump is to use a liquid discharge valve. Closing the liquid discharge valve will cause a decrease in the flow rate since the pump will operate against a higher discharge pressure.
Solenoid control of the inlet air may also be used in order to facilitate remote operation. A three way solenoid valve is recommended, in order to allow the air to “bleed off” between the solenoid and the pump. Do not use valves for flow control on the suction side of the pump. (Closing or partially closing a liquid suction valve restrict the suction line and may cause damage to the diaphragms.) Suction strainers may be employed to reduce or eliminate larger solids, but routine maintenance is necessary in order to prevent a restriction on the suction.

MAINTENANCE
Due to the unique nature of each application, periodic inspection of the pump is the best method to determine a proper maintenance schedule. A record should be kept of all repairs made to an installed pump. This will serve as the best predictor of future maintenance.
Typical maintenance involves replacing of “wear-parts” such as the diaphragms, balls, valve seats and O-rings. Proper maintenance can ensure trouble-free operation of the pump. Refer to repair and assembly instructions for further details.

WARNING Maintenance must not be performed when a hazardous atmosphere is present.

MAINTENANCE SCHEDULE
WEEKLY (OR DAILY)
Make a visual check of the pump. If pumped fluid is leaking out of the pump, pipe fittings or muffler turn off pump and schedule maintenance.

EVERY THREE MONTHS
Inspect fasteners and tighten any loose fasteners to recommended torque settings.
Schedule pump service based on pump’s service history.
REPAIR AND ASSEMBLY

PUMP WET END REMOVAL

TOOLS NEEDED
1) Two Wrenches, 7/16 Inch
2) One Wrench, ½ Inch
3) Two Wrenches, ¾ Inch
4) One Screwdriver, Straight Blade

WARNING Prior to servicing the pump, ensure that the air and fluid lines are closed and disconnected. While wearing personal protective equipment, flush, drain and process liquid from the pump in a safe manner.

WARNING Maintenance must not be performed when a hazardous atmosphere is present.

STEP 1
Using the 7/16 inch wrenches remove four “Hex-Head Cap Screws”, eight “Washers” and four “Hex Nuts” from the “Discharge Manifold”, “Outer Chamber” and “Suction Manifold”.

STEP 2
Remove the “Discharge Manifold”.  

STEP 3
Remove the “O-Ring”, “Max-Pass™ Backup” and “Max-Pass™ Valve” from the “Discharge Manifold”.

STEP 4
Set the “Intermediate” with attached “Outer Chambers” aside.

STEP 5
Remove the “Suction Manifold”.

STEP 6
Remove the “O-Ring”, “Max- Pass™ Backup” and “Max-Pass™ Valve” from the “Outer Chambers”.

To assemble the wet end of the pump, reverse the order of disassembly. Ensure all hardware is fastened in accordance with torque specifications (see page 15). Inverting one of the diaphragms during reassembly will facilitate ease of assembly.

When positioning clamps use soapy water or a compatible lubricating spray on the inside of band clamps to aid assembly. Tap with a mallet on the outside of clamp to help position the clamp while tightening the fasteners. The band clamp fasteners and cap screws are stainless steel. To prevent galling always apply an anti-seize compound to the thread.

Note: When using pumps built with PTFE O-Rings, always replace with new PTFE O-Rings, since the original O-Rings may not reseal the pump.
REPAIR AND ASSEMBLY

AIR VALVE REMOVAL

TOOLS NEEDED
1) One Wrench, ¼ Inch
2) One Screwdriver, Straight Blade
3) One Hex Key, 7/64 Inch (3mm)

WARNING Prior to servicing the pump, ensure that the air and fluid lines are closed and disconnected. While wearing personal protective equipment, flush, drain and process liquid from the pump in a safe manner.

WARNING Maintenance must not be performed when a hazardous atmosphere is present.

STEP 1
Rotate the “Intermediate” to the exhaust muffler side.

STEP 2
Using the 1/4 wrench (or straight blade screwdriver) remove six “Screws” from the “Muffler Plate”. Note the center two “Screws” should not be removed.

STEP 3
Stabilize the “Air Valve” mechanism to prevent it from shifting. Move the mechanism to the “Hard Stop” position. See Step 4-5.

STEP 4
CAUTION: Only one side of the valve mechanism has a hard-stop. Shifting the mechanism past its operating position can cause the spring to pop free and internal components to come loose. Use caution when shifting the mechanism manually.

STEP 5

STEP 6
Remove the “Air Valve” from the “Intermediate”. Set the mechanism to the “Hard Stop” position.
STEP 7
Note the way the mechanism threads the “Rod” and “Rod Guide”.

STEP 8
To reinstall the “Air Valve”, the spring mechanism should be on the side with the hard-stop. Prop the spring retainer into a neutral position by inserting a \( \frac{7}{64} \) or 3mm hex key as shown between the hard-stop and the spring retainer.

STEP 9
Adjust the “Rod Guide” towards the center of the “Intermediate”. Slide the “Air Valve” into place so that the forks slide into the rod guide. Pull the hex key free and push the “Air Valve” fully into place. Reinstall the “Muffler Plate” screws.

AIR VALVE ASSEMBLY
To assemble the air valve, reverse the order of disassembly. During assembly, ensure that the open side of the lip-seals are both facing each other inward. Lubrication of the air valve assembly, with a non-synthetic lubricant, is recommended. Magna-Lube or Magna-Plate are recommended for assembly lubrication (see detailed parts list for ordering information).

Note: If the lip-seals are installed incorrectly, they will be unable to rotate.

TORQUE SPECIFICATION CHART
RECOMMENDED TORQUE SPECIFICATIONS

Note: Always torque the chamber clamps prior to the manifold bolts. When reassembling, loosely tighten all external fasteners adjusting and aligning gradually, in an alternating fashion, tighten to torque requirements listed above.

Note: When using pumps built with PTFE O-Rings, always replace with new PTFE O-Rings, since the original O-Rings may not reseal the pump.

ELASTOMERS & REPAIR KITS
WETTED ELASTOMERS

**BUNA-N (NITRILE)**
is a general purpose elastomer used with water and many oils. Temperature range 10°F to 180°F (-12°C to 82°C).

**GEOLAST®**
is an injection molded thermoplastic material with characteristics similar to Nitrile. Has excellent abrasion resistance. Temperature range 10°F to 180°F (-12°C to 82°C).

**EPDM**
is a general purpose elastomer with good resistance to many acids and bases. Temperature range -40°F to 280°F (-40°C to 138°C).

**SANTOPRENE®**
is an injection molded material with characteristics similar to EPDM. Has excellent abrasion resistance. Temperature range -40°F to 225°F (-40°C to 107°C).

**FKM**
is an elastomer with good corrosion resistance to a wide variety of chemicals. Temperature range -40°F to 350°F (-40°C to 177°C).

**GEOLAST®**
is an injection molded thermoplastic material with characteristics similar to Nitrile. Has excellent abrasion resistance. Temperature range 10°F to 180°F (-12°C to 82°C).

**PTFE (POLYTETRAFLUOROETHYLENE)**
is a thermoplastic polymer that is inert to most chemicals. Temperature range 40°F to 220°F (4°C to 104°C).

Most of the above elastomers are available in FDA approved formulations.

Warning: The TX marking refers to the maximum surface temperature depending not on the equipment itself, but mainly on operating conditions. In this case, the maximum surface temperature depends upon the temperature of the process fluids.
WARRANTY AND REGISTRATION

WARRANTY. All All-Flo products shall be covered by the standard All-Flo Limited Warranty in effect at the time of shipment. This warranty (which may be modified by All-Flo at any time) provides:

MATERIALS SOLD ARE WARRANTED TO THE ORIGINAL USER AGAINST DEFECTS IN WORKMANSHIP OR MATERIALS UNDER NORMAL USE (RENTAL USE EXCLUDED) FOR FIVE YEARS AFTER PURCHASE DATE. ANY PUMP WHICH IS DETERMINED TO BE DEFECTIVE IN MATERIAL AND WORKMANSHIP AND RETURNED TO ALL-FLO, SHIPPING COSTS PREPAID, WILL BE REPAIRED OR REPLACED AT ALL-FLO’S OPTION. CUSTOMER SHALL NOTIFY ALL-FLO IN WRITING WITHIN 30 DAYS OF ANY CLAIMED DEFECTS. NO MATERIALS CAN BE RETURNED WITHOUT THE PRIOR CONSENT OF ALL-FLO, AND IF APPROVED SHALL BE RETURNED TO ALL-FLO FREIGHT PREPAID. ALL-FLO’S LIABILITY FOR ANY BREACH OF THIS WARRANTY SHALL BE LIMITED TO EITHER REPLACEMENT OF THE MATERIALS OR, AT ALL-FLO’S SOLE OPTION, THE REFUND OF THE PURCHASE PRICE. ALL-FLO SHALL NOT BE HELD LIABLE FOR ANY INCIDENTAL OR CONSEQUENTIAL DAMAGES CAUSED BY BREACH OF THIS WARRANTY. THIS EXCLUSION APPLIES WHETHER SUCH DAMAGES WERE SOUGHT BASED ON BREACH OF WARRANTY, BREACH OF CONTRACT, NEGLIGENCE, STRICT LIABILITY IN TORT, OR ANY OTHER LEGAL THEORY. FURTHER, ALL-FLO SHALL NOT BE LIABLE FOR LOSSES, DELAYS, LABOR COSTS, OR ANY OTHER COST OR EXPENSE DIRECTLY OR INDIRECTLY ARISING FROM THE USE OF MATERIALS. ALL-FLO’S LIABILITY IS EXPRESSLY LIMITED TO THE REPLACEMENT OR REPAIR OF DEFECTIVE GOODS, OR THE TOTAL VALUE OF SUCH GOODS. THIS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, WHETHER EXPRESS, IMPLIED, OR ORAL INCLUDING THE IMPLIED WARRANTY OF MERCHANTABILITY, ANY IMPLIED WARRANTY OF FITNESS FOR A PARTICULAR PURPOSE, AND ANY IMPLIED WARRANTIES OTHERWISE ARISING FROM A COURSE OF DEALING OR TRADE. All-Flo will not, in ANY event, be liable for any loss of profit, interruption of business or any other special, consequential or incidental damages suffered or sustained by Customer. All-Flo’s total maximum liability to the customer in respect of sale of materials or services rendered by All-Flo is limited to the total monies received by All-Flo from the customer for the particular materials described in Customer’s order.

All-Flo does not warrant any part or component that it does not manufacture, but will assign to the original end-user purchaser of any warranty received by it from the manufacturer, to extent such pass through is permitted by the manufacturer.

All-Flo is committed to the pursuit of designing and manufacturing the highest quality product available to industry. Since the beginning in 1986, All-Flo engineers have used their extensive knowledge of today’s engineered materials, advanced air system logic and manufacturing techniques to develop the superior group of lube-free, air-operated diaphragm pumps found in this catalog. Every pump is performance engineered and quality built to provide trouble-free service under the toughest conditions.
