SAFETY DATA

This is a SAFETY ALERT SYMBOL.
When you see this symbol on the product, or in the
manual, look for one of the following signal words and be
alert to the potential for personal injury, death or major
property damage

DANGER
Warns of hazards that WILL cause serious personal injury,
death or major property damage.

WARNING
Warns of hazards that CAN cause serious personal injury,
death or major property damage.

CAUTION
Warns of hazards that CAN cause personal injury
or property damage.

NOTICE:
Indicates special instructions which are very
important and must be followed.

NOTICE:
Blackmer Air Valves MUST only be installed in systems
which have been designed by qualified engineering
personnel. The system MUST conform to all applicable
local and national regulations and safety standards.
This manual is intended to assist in the installation and
operation of the Blackmer Air Valves, and MUST be kept
with the pump.
Blackmer Air Valve service shall be performed by
qualified technicians ONLY. Service shall conform to all
applicable local and national regulations and safety
standards.
Thoroughly review the pump manual and all Air Valve
instructions and hazard warnings, BEFORE performing
any work on the Blackmer Air Valves.
Maintain ALL system and Blackmer air valve pump
operation and hazard warning decals.
SAFETY DATA

WARNING
Hazardous machinery can cause serious personal injury or property damage.

Failure to set the vehicle emergency brake and chock wheels before performing service can cause severe personal injury or property damage.

WARNING
Hazardous machinery can cause serious personal injury or property damage.

Failure to disconnect and lockout electrical power or engine drive before attempting maintenance can cause serious personal injury or death.

WARNING
Hazardous machinery can cause severe personal injury.

Failure to relieve system pressure prior to performing pump service or maintenance can cause personal injury or property damage.

WARNING
Hazardous or toxic fluids can cause serious injury.

If pumping hazardous fluids, the system must be flushed and decontaminated prior to performing service or maintenance.

WARNING
Hazardous fluids can cause fire, serious personal injury or property damage.

All fluids pumped must be compatible with piston material. Incompatibility can cause fire, serious personal injury or property damage.

WARNING
Hazardous pressure can cause serious personal injury or property damage.

Failure to disconnect and lockout electrical power or engine drive before attempting maintenance can cause serious personal injury or death.

WARNING
Hazardous pressure can cause personal injury or property damage.

All fluids pumped must be compatible with piston material. Incompatibility can cause fire, serious personal injury or property damage.

WARNING
Hazardous pressure can cause personal injury or property damage.

Failure to set the vehicle emergency brake and chock wheels before performing service can cause severe personal injury or property damage.

WARNING
Hazardous pressure can cause personal injury or property damage.

If pumping hazardous fluids, the system must be flushed and decontaminated prior to performing service or maintenance.

WARNING
Hazardous fluids can cause fire, serious personal injury or property damage.

Failure to relieve system pressure prior to performing pump service or maintenance can cause personal injury or property damage.

NOTICE:
Installation and maintenance shall be performed by qualified technicians only, following the appropriate procedures and warnings as presented in this manual and the appropriate pump installation, operation, and maintenance instructions.

The Blackmer Air Valve is a piston type actuator (see parts list drawing on page 7). The air valve is designed to work with a flow sensing pilot valve (air or electric) which puts pressure behind the piston when the nozzle is open and fluid is flowing. This permits high pressure operation of the pump. When the nozzle is closed and flow is stopped, the flow sensing pilot valve relieves the actuating pressure from behind the piston and the pump will automatically go into low pressure bypass.

Approximately 70 psi (4.8 bar) minimum air pressure is required to properly operate the air valve control system. Air pressure MUST NOT exceed 125 psi (8.6 bar).

INSTALLATION

PRE-INSTALLATION CLEANING

Foreign matter entering the pump WILL cause extensive damage. The pump and the surrounding area MUST be cleaned prior to attempting air valve installation.

NOTICE:
A preset, spring loaded air check valve must be installed in the vehicle air supply line to ensure minimum safe air pressure for the brake system.
INSTALLATION

MOUNTING THE AIR/RELIEF VALVE
1. Remove the pump relief valve cap (1) and turn the adjusting screw (2) counterclockwise to relieve spring tension, reference the pump maintenance manual.
2. Remove and discard the pump’s four relief valve cover bolts (5 & 5C). Remove the cover assembly (4), spring guide (7), spring (8), and gasket (10). Clean and inspect the gasket surfaces, repairing as necessary.
3. Install a new gasket (10).
4. Attach the Air Valve assembly to the pump using the four new bolts provided (5 & 5C). Ensure the relief valve spring is seated in the piston boss. Position the valve cover (4) so that the air inlet pipe hole is accessible to attach the air line.

NOTICE:
The relief valve spring must be confined between the boss on the relief valve (9) and the boss on the piston (11A).

5. Torque the air valve mounting bolts as indicated in Table 1.

Table 2 – Blackmer Piston Air Valve Settings

LOW PRESSURE ADJUSTMENT:
The air valve low pressure adjustment MUST be set first.

NOTICE:
The air valve low pressure setting regulates the delivery hose pressure when the nozzle is closed. Adjust the air valve only high enough to open the flow sensing valve.

1. Adjustment MUST be made with the pump at normal idle speed - 200 RPM minimum.
2. SLOWLY close the delivery nozzle, allowing the pressure to be relieved inside the air valve cap.
3. Remove the air valve cap (1) and O-ring (88).
4. Turn the adjusting bushing (2C) clockwise to increase the pressure setting, or counterclockwise to decrease the pressure setting. Refer to Table 2 for setting ranges.
5. Install O-ring and air valve cap, tighten the cap securely.
6. Open and close the delivery nozzle several times to ensure the correct setting.

HIGH PRESSURE ADJUSTMENT: Do not exceed the maximum pressure listed in Table 2.

1. Adjustment MUST be made with the pump at normal operating speed and with air pressure behind the air valve piston.
2. Slowly close the delivery nozzle, allowing the pressure to be relieved inside the air valve.
3. Remove the air valve cap.
4. Adjust the jam nuts counterclockwise to increase the pressure setting or clockwise to decrease the pressure setting, until the required high pressure setting is achieved. See Table 2 for setting ranges.
5. Install the air valve cap securely.
6. Open the delivery nozzle and observe the pump’s discharge gauge. Repeat steps 2-5 until required high pressure setting is achieved.
7. After the final adjustment is made, ensure that the jam nuts (11E) are tight. Inspect the air valve cap O-ring (88) and replace as necessary.

NOTICE:
Always use a counter wrench (opposing wrench) when tightening the jam nuts (11E). Always start with the jam nuts turned all the way down, clockwise, against the adjusting bushing.

Incorrect settings of the Blackmer air valve can cause system component failure, personal injury and property damage.

Failure to relieve system pressure prior to performing pump service or maintenance can cause personal injury or property damage.

NOTICE:
Where regulations require, holes in R/V cap (1) and capscrew w/hole (5C) are used by the Weights and Measures official(s) to apply a security seal or tag.
Air Systems for Automatic Pressure and Speed Control

The pump is equipped with an adjustable spring actuated relief valve. The spring bears against a piston. With the air pressure on the piston, the valve controls pressure in the conventional manner. When air pressure is removed, the relief valve opens wide, reducing the system pressure.

The pilot valve senses flow. It closes when the nozzle closes and removes air pressure from the pump air valve and the air cylinder on the engine speed control.

When the nozzle is opened, the liquid flow actuates the pilot valve. Air pressure on the air cylinder then speeds up the engine and pump to a preset value and, by pressurizing the pump air valve, increases the system pressure to obtain the desired flow.

Closing the nozzle automatically reduces the engine and pump speed to an idle, and reduces the system pressure, making the hose easier to handle. The net effect also reduces wear and tear on the equipment.

The nozzle may be partially closed to “top off” a tank in the same manner as when a Blackmer pump with the standard relief valve is used.

Rigidly mount the engine speed control air cylinder to prevent variations in the speed control.

Electric/Hydraulic Systems For Automatic Pressure And Speed Control

Failure to provide full flow discharge piping, a properly grounded system and system components will cause static electricity, incendiary sparks and ignition of explosive liquids.

Failure to mount the 3-way pneumatic valve away from heat, flame, sparks or outside the engine compartment can cause fire, personal injury or property damage.

The pump is equipped with an adjustable spring relief valve. The spring bears against the piston. With pump discharge pressure on the piston, the valve controls pressure in the conventional manner. When the pump discharge pressure is removed, the relief valve opens wide, reducing the system pressure.

The flow switch “senses” flow. With the pump running and the nozzle open, liquid causes the electrical switch to close and energize the solenoids. The solenoid on the carburetor or injection pump causes the engine and pump to speed up to a pre-set value. At the same time, the solenoid valve at the pump uses the pump discharge pressure to change the bypass setting at the pump, increasing the system pressure to obtain the desired flow.

Closing the nozzle opens the flow switch, automatically reduces the engine speed to an idle, and reduces the system pressure, making the hose easier to handle. The net effect also reduces wear and tear on the equipment. The nozzle may be partially closed to “top off” a tank in the same manner as when a Blackmer pump with the standard relief valve is used.

Rigidly mount the engine speed control solenoid to prevent variations of the engine speed.
MAINTENANCE

NOTICE:
Maintenance shall be performed by qualified technicians only, following the appropriate procedures and warnings as presented in this manual and the appropriate pump installation, operation, and maintenance instructions.

WARNING
Failure to set the vehicle emergency brake and chock wheels before performing service can cause severe personal injury or property damage.

WARNING
Hazardous machinery can cause serious personal injury or property damage.

Failure to disconnect and lockout electrical power or engine drive before attempting maintenance can cause serious personal injury or death

WARNING
Hazardous machinery can cause serious personal injury.

All fluids pumped must be compatible with piston material. Incompatibility can cause fire, serious personal injury or property damage.

WARNING
Hazardous fluids can cause serious injury.

Hazardous or toxic fluids can cause serious injury.

If pumping hazardous fluids, the system must be flushed and decontaminated prior to performing service or maintenance.

WARNING
Hazardous pressure can cause personal injury or property damage.

Hazardous pressure can cause personal injury or property damage.

Failure to relieve system pressure prior to performing pump service or maintenance can cause personal injury or property damage.

AIR VALVE MAINTENANCE AND INSPECTION SCHEDULES

<table>
<thead>
<tr>
<th>Valve Assembly Part</th>
<th>Inspection Schedule</th>
<th>Action Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Breather Vent (6A)</td>
<td>Weekly</td>
<td>If leakage is present, IMMEDIATE valve service is required.</td>
</tr>
<tr>
<td>Air Valve Assembly</td>
<td>Annually</td>
<td>Disassemble, inspect U-cup/ Quad Ring seals and replace if cracked, blistered or worn.</td>
</tr>
<tr>
<td>Piston Assy. (11)</td>
<td>3 Years (Or Less)</td>
<td>REPLACE</td>
</tr>
</tbody>
</table>

AIR VALVE REMOVAL AND DISASSEMBLY

1. Remove the cap (1) from the air valve assembly. Remove and discard the cap O-ring (88).
2. Remove the retaining ring (11F) and jam nuts (11E) from the adjusting rod. Turn the adjusting bushing (2C) counterclockwise to reduce spring tension.
3. Remove the four capscrews (5 & 5C) and washers (5A & 5B).
4. Carefully remove the air valve assembly, spring (8), and if necessary, the valve (9).
5. Remove and discard the gasket (10). Clean gasket areas.
6. Clean the breather vent (6A) with an air hose to remove any foreign matter.
7. Remove the piston (11A) with the attached adjusting rod (11B). Inspect the coating on the piston outer diameter for scratches, wear and surface damage. Discard the piston if the coating is worn or damaged.
8. Remove the U-cup (6) and quad ring seals (7), being careful not to scratch the grooves in the piston cover (4) and discard.
9. Thread the adjusting bushing (2C), CLOCKWISE completely into the valve cover (4).
AIR VALVE ASSEMBLY

**NOTICE:**
Prior to assembly, the piston outer diameter and piston cover bore & U-cup/Quad Ring grooves must be lightly coated with a lithium based grease. Remove any grease in the breather vent hole.

1. Install the U-cup (6) and Quad Ring (7) seals as shown in Figure 3. Install the U-cup seal with the V-groove feature facing the air supply. Install the Quad Ring in the cover groove on the liquid side of the Air Valve. The U-cup and Quad Ring must be oriented as shown to properly seal and prevent cross-contamination between the air supply and pumpage.

2. Insert the piston with the attached adjusting rod (11B) into the adjustment bushing (2C).

3. Install both jam nuts (11E) all the way down to the adjusting bushing and replace the retaining ring (11F).

**NOTICE:**
The relief valve spring must be confined between the boss on the relief valve (9) and the boss on the piston (11A).

4. If removed, reinstall the valve (9). Place the spring (8) between the boss on the piston assembly and the valve. Mount the air valve assembly to the pump, ensuring that the gasket is properly seated. Torque the capscrews (5 & 5C) as indicated in Table 1.

5. Install a new gasket (10) and insert the four capscrews (5 & 5C) with washers (5A & 5B) into the air valve assembly.

6. With a new O-ring (88) installed, attach the air valve cap (1) securely.

7. Adjust the new valve as provided in the “Air Valve Adjustment” section of this manual.
